Secure Your Cloud Applications

Google G Suite is a powerful tool with collaborative capabilities for companies of all sizes. At ManagedMethods, we have built a simple, yet effective security tool that compliments the native security features in G Suite at an affordable price.

## Additional Layer of Security and Visibility

Many IT leaders mistakenly believe that their cloud data is sufficiently secured with Google's native security features. In truth, if you are solely relying on G Suite security, your company's data is likely vulnerable to data breaches, both unintentional and malicious.

ManagedMethods uses a blend of security partnerships and proprietary technology to provide G Suite users with an additional layer of security that gives IT leaders and managers peace of mind. The platform also provides visibility and control to account activity, 3rd party application usage, and content sharing within the corporate environment.

Securing Your G Suite Cloud Environment

Data security shouldn't stop and start at your gateway. ManagedMethods is the only cloud application security solution that secures your file sharing, email, and 3rd party applications all in one easy-to-use platform. We'll let you know what is going on within G Suite, as well as what it coming in and going out.

Gain visibility into email spoofing and malware attacks and prevent data loss in Google Drive and Team Drives. Using templated or customized policies, you can be assured that your sensitive data is properly secured while you're busy putting out fires elsewhere. With ManagedMethods, this security also extends beyond Google supported file types to include files such as PDFs and JPGs. We also support security needs for any OAuth based applications, including Office 365, Slack, Dropbox, and Box.

Save Time Running Reports and Auditing

ManagedMethods makes auditing your cloud environment, running security reports, and understanding trends easier and less time-consuming. Our reporting features works across your cloud environment, including cloud applications such as Office 365, Slack, and Dropbox as well as G Suite. With ManagedMethods, auditing your cloud environment happens all within one easy-to-use platform.
